Year : Second year

Semester ,batch : Fourth Semester, H Batch

College : **College of Engineering, Guindy.**

Travels and Tourism

Objective :

The main aim of the project is to learn Web technology concepts using Java Programming. The main purpose for developing this site is to provide user with facilities of booking tickets online .

Components Used :

Front End	:	JavaScript / HTML
Back End	:	JDBC / JSP

Abstract :

Our project is to design a website for booking travels and plan for a tour. The website is designed using Java Server pages and has a database connectivity at the backend. The Online Tours and Travels website is useful for the customers who like to book the Ticket online without going to booking office and dealing face to face. It provides the facility to the customers or the users to have complete information about the Tours and Travels at one place. The user can easily get idea as where to book the tickets and choose the destination where he wants to visit. The user easily understands about area and place to travel.

The website provides a complete view on the tourism spots in India and also in Chennai. It also provides details about the packages for tours . On the other hand, the site also has a login page for existing users and registration page for new users. In addition, one can book for a trip online and enjoy the trip. Customer record is stored in database which contains his/her name, address, contact number.

There are two types of logins. The user login and the admin login. The user can only manage his account , while the admin can manage all the accounts, make updations if necessary and add/delete contents from the webpage.

Advantages of the system :

- Can be used by tour operators and travel booking operators
- Saves a lot of time in booking by standing in a long queue
- Can search the package he wishes to , thereby giving a variety of options for viewing.
